What if we measure from the 7 kg mass?

$$X_{cm} = \frac{\sum x \cdot m}{\sum m} = \frac{0 \cdot 7 + 5 \cdot 3 + 10 \cdot 5}{7 + 3 + 5} =$$

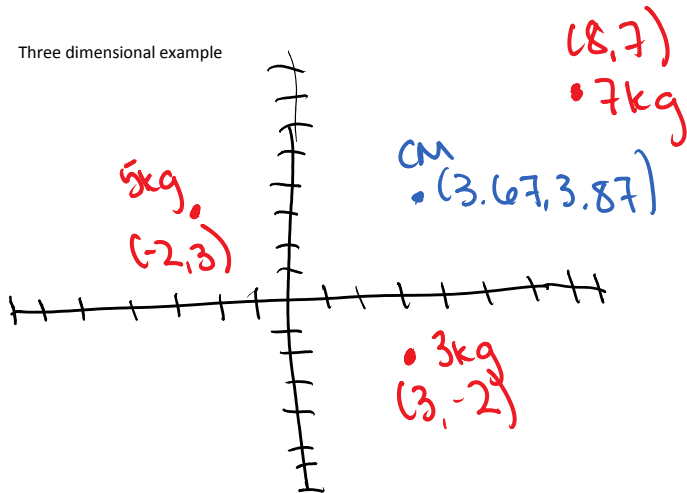

$$= \frac{0 + 15 + 50}{15} = \frac{65}{15} = 4.33$$

50 cm is $8 - 4.33 \rightarrow 3.67$ on the # line

What if we measure from the origin?

$$X_{cm} = \frac{\sum x \cdot m}{\sum m} = \frac{5 \cdot (-2) + 3 \cdot (3) + 7 \cdot (8)}{7 + 3 + 5} = \frac{-10 + 9 + 56}{15} = \frac{55}{15} = 3.67 \text{ (distance)}$$

Three dimensional example

$$X_{cm} = \frac{\sum x m}{\sum m} = \frac{-2 \cdot 5 + 3 \cdot 3 + 8 \cdot 7}{5 + 3 + 7} = \frac{-10 + 9 + 56}{15} = 3.67$$

$$Y_{cm} = \frac{\sum y m}{\sum m}$$

$$= \frac{3 \cdot 5 + (-2) \cdot 3 + 7 \cdot 7}{5 + 3 + 7}$$

$$= \frac{15 - 6 + 49}{15} = 3.87$$
